# SIPP User Notes 

To: SIPP Users<br>From: Heather Boushey, economist, Center for Economic and Policy Research<br>RE: Set C: Household and Family Relationships<br>Date: January 30, 2006

Set C covers the household and family relationships of SIPP respondents. This note documents the correspondence of the SIPP with published data sources, finding that they match closely. The definitions of variables are consistent across panels with the exception that the 1996 and 2001 SIPP panels identify the mother, father, and/or guardian of each child, while in the 1992 and 1993 panels, only the primary parent or guardian is identified. This means that we can count the number of children per father or mother in the later panels, but it is not possible in the 1992 and 1993 panels. Appendix 1 provides a list of the variables included in Set C.

## Defining households and families

Households are uniquely identified in the SIPP so that a user can follow one household over the course of the panel. However, families are not as they are subject to changes in composition. Thus, the SIPP only provides indicators for whether a group of individuals constitutes a family (primary or sub-family). One idea for following families over time is to create a unique family id variable by concatenating the id's of all family members in the first month of interest and then determining if this same configuration of individuals remains in the family. Set C includes all variables that the user would need to make these determinations.

For each panel, CEPR and Census come up with the exact same number of individuals in households, families, and sub-families. ${ }^{1}$ However, CEPR counts do not identically match counts of children within families or subfamilies. According to Census staff, this is because there are children who point to unrelated parents. ${ }^{2}$ Tables 1 through 4 show the differences in the counts of children in families between the CEPR calculations and the Census calculations. The counts are by person-month; the 1992 and 1993 panels are about half as large as the 1996 and 2001 panels. The 2001 panel is still small, compared to the 1996 because we only have the first six waves at this time.

[^0]A second issue in $\operatorname{Set} \mathrm{C}$ is the matching of children to adults. This requires that a unique id be created for all parents, which are then matched to the ids noted in the children's file pointing to their parent. We have created a program entitled "attach" that attaches children to their parents. After doing so, we can count the number of children per parent (mother, father, or guardian in the 1996 and 2001 panels; primary parent/guardian in the 1992 and 1993 panels), per family, or per household. Set C includes the number of children by age group for mothers and fathers in the 1996 and 2001 panels, as well as sub-family for all panels. Users may choose other ways of counting the number of children by age, such as children in households, or change the age groups, by making changes to the "attach" program embedded in the "Clean Set C".

## Comparing the SIPP with other published data

Table 5 shows the average number of children and adults per household, for March of each year. The SIPP Set C variables used here are famkid and hh_ads. The "check" data are taken from the March CPS. The standard errors of the CPS data generally fall between 0.01 and 0.02 , so for most of the years shown below, the differences for the children data are not statistically significant, though for the adult data the differences are statistically significant (greater than twice the standard error).

Table 5: Average Number of Children and Adults Per Household

## Appendix: Variable List

| variable | label |
| :--- | :--- |
| Merging Variables (appear on every Set) |  |
| id | Unique ID |
| srefmon | Reference month |
| wave | Wave of data collection |
| age | Age in this month |

Variables in this set only
dkid0 Number of Infants (first year) for a Dad (96 and 01)
dkid1 Number of Children in their first year for a Dad (96 and 01)
dkid2 Number of Children in their second year for a $\operatorname{Dad}(96$ and 01)
dkid3 Number of Children in their third year for a Dad (96 and 01)
dkid4 Number of Children in their fourth year for a Dad (96 and 01)
dkid5 Number of Children in their fifth year for a Dad (96 and 01)
dkid0t5 Number of Children aged 0 to 5 for a Dad (96 and 01)
dkid0t17 Number of Children aged 0 to 17 for a Dad (96 and 01)
dkid6t12 Number of Children aged 6 to 12 for a Dad (96 and 01)
dkid13t17 Number of Children aged 13 to 17 for a Dad (96 and 01)
dyngst Age of the Dad's youngest child (96 and 01)
fam_ads Number of adults in family, including subfamily
famkid Number of kids (less than 18) in family, including subfamily
hh_ads Number of Adults in the household
hhid Unique Household ID
mkid0 Number of Infants (first year) for a Mom (96 and 01)
mkid1 Number of Children in their first year for a Mom (96 and 01)
mkid2 Number of Children in their second year for a Mom (96 and 01)
mkid3 Number of Children in their third year for a Mom (96 and 01)
mkid4 Number of Children in their fourth year for a Mom (96 and 01)
mkid5 Number of Children in their fifth year for a Mom (96 and 01)
mkid0t5 Number of Children aged 0 to 5 for a Mom ( 96 and 01)
mkid0t17 Number of Children aged 0 to 17 for a Mom (96 and 01)
mkid6t12 Number of Children aged 6 to 12 for a Mom (96 and 01)
mkid13t17 Number of Children aged 13 to 17 for a Mom (96 and 01)
myngst Age of the Mom's youngest child (96 and 01)
pfid Unique Family ID
rfnkids FA: Total number of children under 18 in family

skid0t5 Number of Children aged 0 to 5 for a Family (by sfid: sub/primary families separate)
skid0t17 Number of Children aged 0 to 17 for a Family (by sfid: sub/primary families separate)
skid6t12 Number of Children aged 6 to 12 for a Family (by sfid: sub/primary families separate)
skid13t17 Number of Children aged 13 to 17 for a Family (by sfid: sub/primary families separate)
spouseid Spouse id
syngst Age of the Family's youngest child (by sfid: sub/primary families separate)

## Note: variables are available in all panels except where noted

[^0]:    1 We match our count of household members to ehhnpp, for families to efnp, and for sub-families to esfnp. Our counts for subfamilies do match exactly, however, because we put all individuals in a sub-family, whereas Census only puts those in sub-families in households with more than one family into a sub-family. This way, our sub-family id variable identifies all unique families.
